AMS Soil Probe

The AMS Soil Probe has proven effectiveness under all kinds of conditions. AMS Soil Probes are trusted worldwide as the instrument of choice among farmers, agricultural consultants, fertilizer technicians and other professionals whose job it is to retrieve samples to analyze soil for nutrient, moisture content and consistency. They can also be used to take turf samples in parks, golf courses or yards. Soil Probes are a great tool to bore small diameter holes around trees or shrubs for direct fertilization.

Manufactured from high-strength, aircraft quality 4130 chrome plated alloy or stainless steel with a hardened or heat-treated tip, all AMS Soil Probes come with a cross handle. AMS Soil Probes set the industry standard.

For harder soils or deeper soil sampling the AMS Soil Probes may be used with the AMS Slide Hammer or Extensions.

The probe cuts a sample slightly smaller than the inside diameter of the probe to facilitate easy sample removal.
