

Horizontal Beta Water Samplers

- Large volume - from 2.2 to 8.2 liters
- Amber latex closing tube for cleanliness
- Kits include bottle, plastic carry case, 45-B10 messenger & 62-C15 line (100 ft.)
- Bottles & bottles with cases also available

Intended for deep or shallow waters, these “horizontal” bottles are pulled sideways just before closing. This ensures a representative water sample for that specific depth of water. They cannot be used in series because their release mechanisms are at the end of a line or cable. They are ideal, however, for sampling at the thermocline, at other stratification levels, or just above the bottom sediments. Beta™ bottles come in your choice of transparent acrylic or opaque PVC. PVC is more durable and less costly, but the acrylic allows you to view the contents immediately. Not suitable for trace metals or organics beyond concentrations of mg/L). A thermometer can be mounted to acrylic Beta™ bottles. This sampler requires a messenger and line (not included, except in kits) for operation.
